Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

Aim: Write a python program to create, append and remove lists in python.

IDE:

A collection of items can be managed and stored in an ordered sequence using a Python list, a flexible and robust data structure. Because lists may hold components of several data types—integers, texts, and even other lists—they are incredibly versatile for various computer applications. You can quickly add, remove, and alter elements from Python lists and carry out operations like sorting and slicing.

Example of List in Python

ages = [19, 26, 29]
print(ages)

```
ages = [19, 26, 29]
print(ages)
```

Output:

```
[19, 26, 29]
```

Task:

a = list(range(5))
print(a)

```
a = list(range(5))
print(a)
```

Output:

```
In [2]: a = list(range(5))
   ...: print(a)
   ...:
[0, 1, 2, 3, 4]
```

b = list(range(5,10))
print(b)

```
b = list(range(5, 10))
print(b)
```

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

Output:

```
In [2]: b = list(range(5, 10))
   ...: print(b)
   ...:
[5, 6, 7, 8, 9]
```

c = list(range(0,10,2))
print(c)

```
c = list(range(0, 10, 2))
print(c)
```

output:

```
In [3]: c = list(range(0, 10, 2))
   ...: print(c)
   ...:
   ...:
[0, 2, 4, 6, 8]
```

d = list(range(10,0,-2))
print(d)

```
d = list(range(10,0,-2))
print(d)
```

output:

```
In [5]: d = list(range(10,0,-2))
   ...: print(d)
   ...:
[10, 8, 6, 4, 2]
```

Add Elements to a Python List

1. Python append() Method

Adds element to the end of a list.

List = ['Mathematics', 'chemistry', 1997, 2000]
List.append(20544)
print(List)

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
list = ['3EK2', 'ICT', 'Department', 1997, 2000]
list.append(20544)
print(list)
```

Output:

```
In [7]: list = ['3EK2', 'ICT', 'Department', 1997, 2000]
   ...: list.append(20544)
   ...: print(list)
   ...:
   ...:
['3EK2', 'ICT', 'Department', 1997, 2000, 20544]
```

2. Python insert() Method

Inserts an element at the specified position.

List = ['Mathematics', 'chemistry', 1997, 2000]
# Insert at index 2 value 10087
List.insert(2, 10087)
print(List)

```
list = ['Mathematics', 'Chemistry', 1997, 2000]
list.insert(2, 10087)
print(list)
```

Output:

```
In [8]: list = ['Mathematics', 'Chemistry', 1997, 2000]
   ...: list.insert(2, 10087)
   ...: print(list)
   ...:
   ...:
['Mathematics', 'Chemistry', 10087, 1997, 2000]
```

3. Python extend() Method

Adds items of an iterable(list.) to the end of a list.

List1 = [1, 2, 3]

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

List2 = [2, 3, 4, 5]
# Add List2 to List1
List1.extend(List2)
print(List1)

```
list1 = [1, 2, 3]
list2 = [4, 5, 6, 7]
list1.extend(list2)
print(list1)
```

Output:

```
In [9]: list1 = [1, 2, 3]
   ...: list2 = [4, 5, 6, 7]
   ...: list1.extend(list2)
   ...: print(list1)
   ...:
   ...:
[1, 2, 3, 4, 5, 6, 7]
```

Important Functions of the Python List

1. Python sum() Method
Calculates the sum of all the elements of the List.

List = [1, 2, 3, 4, 5]
print(sum(List))
output

Task:
List = ['gfg', 'abc', 3]
print(sum(List))

```
list = [1, 2, 3, 4, 5]
print(sum(list))
```

Output:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
In [10]: list = [1, 2, 3, 4, 5]
    ...: print(sum(list))
    ...:
15
```

2. Python count() Method

Calculates the total occurrence of a given element of the List.

List = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(List.count(1))

List = [‘a’,’b’,c’,’d’,’a’]
print(List.count(‘a’))

```
list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(list.count(1))

list = ['a','b','c','d','e']
print(list.count('a'))
```

Output:

```
In [11]: list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
    ...: print(list.count(1))
    ...:
    ...: list = ['a','b','c','d','e']
    ...: print(list.count('a'))
    ...:
    ...:
4
1
```

3. Python len() Method
Calculates the total length of the List.

List = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(len(List))

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(len(list))
```

Output:

```
In [12]: list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
    ...: print(len(list))
    ...:
    ...:
10
```

4. Python index() Method

Returns the index of the first occurrence. The start and end indexes are not necessary parameters.

List = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(List.index(2))

```
list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(list.index(2))
```

Output:

```
In [15]: list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
    ...: print(list.index(2))
    ...:
1
```

Task:
List = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(List.index(2, 2))

```
list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
print(list.index(2, 2))
```

Output:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
In [16]: list = [1, 2, 3, 1, 2, 1, 2, 3, 2, 1]
    ...: print(list.index(2, 2))
    ...:
    ...:
4
```

5. Python min() Method

Calculates minimum of all the elements of List.

numbers = [5, 2, 8, 1, 9]

print(min(numbers))

```
numbers = [1, 86, 5, 8, 78]
print(min(numbers))
```

Output:

```
In [17]: numbers = [1, 86, 5, 8, 78]
    ...: print(min(numbers))
    ...:
1
```

6. Python max() Method

Calculates the maximum of all the elements of the List.

numbers = [5, 2, 8, 1, 9]

print(max(numbers))

```
numbers = [1, 56, 8, 89, 53]
print(max(numbers))
```

Output:

```
In [1]: numbers = [1, 56, 8, 89, 53]
   ...: print(max(numbers))
   ...:
   ...:
89
```

7. Python sort() Method

Sort the given data structure (both tuple and list) in ascending order.

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

List = [2.3,4.445,3,5.33,1.054,2.5]
List.sort()
print(List)

```
list = [1.2,2.1,3.1,4.1]
list.sort()
print(list)
```

Output:

```
In [2]: list = [1.2,2.1,3.1,4.1]
   ...: list.sort()
   ...: print(list)
[1.2, 2.1, 3.1, 4.1]
```

List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
#Reverse flag is set True
List.sort(reverse=True)
print(List)

```
list = [2.5, 89.8757, 9.02, 99]
list.sort(reverse=True)
print(list)
```

Output:

```
In [1]: list = [2.5, 89.8757, 9.02, 99]
   ...: list.sort(reverse=True)
   ...: print(list)
   ...:
   ...:
[99, 89.8757, 9.02, 2.5]
```

8. Python reverse() Method
reverse() function reverses the order of list.
# creating a list
list = [1,2,3,4,5]
#reversing the list
list.reverse()
#printing the list

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

print(list)

```
list = [1, 2, 3, 4, 5]
list.reverse()
print(list)
```

Output:

```
In [2]: list = [1, 2, 3, 4, 5]
   ...: list.reverse()
   ...: print(list)
   ...:
   ...:
[5, 4, 3, 2, 1]
```

Deletion of List Elements

To Delete one or more elements, i.e. remove an element, many built-in Python list functions can be used, such as pop() and remove() and keywords such as del.

1. Python pop() Method

Removes an item from a specific index in a list.

List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]

print(List.pop())

```
List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
print(List.pop())
```

Output:

```
In [3]: List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
   ...: print(List.pop())
   ...:
   ...:
2.5
```

List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]

print(List.pop(0))

```
List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
print(List.pop(0))
```

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

Output:

```
In [4]: List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
   ...: print(List.pop(0))
   ...:
2.3
```

2. Python del() Method

Deletes an element from the list using it's index.

List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]

del List[0]

print(List)

```
List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
del List[0]
print(List)
```

Output:

```
In [5]: List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
   ...: del List[0]
   ...: print(List)
   ...:
[4.445, 3, 5.33, 1.054, 2.5]
```

3. Python remove() Method

Removes a specific element using it's value/name.

List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]

List.remove(3)

print(List)

```
List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
List.remove(3)
print(List)
```

Output:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
In [6]: List = [2.3, 4.445, 3, 5.33, 1.054, 2.5]
   ...: List.remove(3)
   ...: print(List)
   ...:
   ...:
[2.3, 4.445, 5.33, 1.054, 2.5]
```

# removing duplicates from a list using dictionaries
my_list_1 = [5, 2, 90, 24, 10, 2, 90, 34]
my_list_2 = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']

# removing duplicates from list 1
my_list_1 = list(dict.fromkeys(my_list_1))
print(my_list_1)

```
my_list_1 = [5, 2, 90, 24, 10, 2, 90, 34]
my_list_2 = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']
my_list_1 = list(dict.fromkeys(my_list_1))
print(my_list_1)
```

Output:

```
In [14]: %runfile C:/Users/devah/Documents/PWP/untitled0.py --wdir
[5, 2, 90, 24, 10, 34]
```

# removing duplicates from list 2
my_list_2 = list(dict.fromkeys(my_list_2))
print(my_list_2)

```
my_list_1 = [5, 2, 90, 24, 10, 2, 90, 34]
my_list_2 = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']
my_list_2 = list(dict.fromkeys(my_list_2))
print(my_list_2)
```

Output:

```
In [19]: %runfile C:/Users/devah/Documents/PWP/untitled1.py --wdir
['a', 'b', 'c', 'd', 'e']
```

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

Combining lists

We can even combine lists with the help of the zip() function which results in a list of tuples. Here each item from list A is combined with corresponding elements from list B in the form of a tuple.

```
# combing lists with the help of zip() function
my_list_1 = [5, 2, 90, 24, 10]
my_list_2 = [6, 3, 91, 25, 12]

# combined
my_combined_list = list(zip(my_list_1, my_list_2))
print(my_combined_list)
```

```
my_list_1 = [5, 2, 90, 24, 10]
my_list_2 = [6, 3, 91, 25, 12]
my_combined_list = list(zip(my_list_1, my_list_2))
print(my_combined_list)
```

Output:

```
In [2]: my_list_1 = [5, 2, 90, 24, 10]
   ...: my_list_2 = [6, 3, 91, 25, 12]
   ...: my_combined_list = list(zip(my_list_1, my_list_2))
   ...: print(my_combined_list)
   ...:
[(5, 6), (2, 3), (90, 91), (24, 25), (10, 12)]
```

Finding the most common item

To find the most frequent element we make use of the set() function. The set() function removes all the duplicates from the list, and the max() function returns the most frequent element (which is found with the help of ‘key’). The key is an optional single argument function.

```
# to find the most frequent element from the list
my_list = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']
most_frequent_value = max(set(my_list), key=my_list.count)
print("The most common element is:", most_frequent_value)
```

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
my_list = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']
most_frequent_value = max(set(my_list), key=my_list.count)
print("The most common element is:", most_frequent_value)
```

Output:

```
In [3]: my_list = ['a', 'a', 'a', 'b', 'c', 'd', 'd', 'e']
   ...: most_frequent_value = max(set(my_list), key=my_list.count)
   ...: print("The most common element is:", most_frequent_value)
   ...:
   ...:
The most common element is: a
```

Flatten a list of lists

Sometimes we encounter a list where each element in itself is a list. To convert a list of lists into a single list, we use list comprehension.

# to flatten a list_of_lists by using list comprehension
list_of_lists = [[1, 2],
[3, 4],
[5, 6],
[7, 8]]
# using list comprehension
my_list = [item for List in list_of_lists for item in List]
print(my_list)

```
list_of_lists = [[1, 2],
                 [3, 4],
                 [5, 6],
                 [7, 8]]
my_list = [item for List in list_of_lists for item in List]
print(my_list)
```

Output:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
In [4]: list_of_lists = [[1, 2],
   ...:                 [3, 4],
   ...:                 [5, 6],
   ...:                 [7, 8]]
   ...: my_list = [item for List in list_of_lists for item in List]
   ...: print(my_list)
   ...:
[1, 2, 3, 4, 5, 6, 7, 8]
```

Post Lab Exercise:

a. Write a Python program to multiply all the items in a list.

```
list = [2, 3, 4, 5]
result = 1
for num in list:
    result *= num
print("Product of all items:", result)
```

Output:

```
Product of all items: 120
```

b. Write a Python program to get the largest number from a list.

Code:

```
list = [5, 12, 7, 20, 3]
largest = max(list)
print("Largest number:", largest)
```

Output:

```
Largest number: 20
```

c. Write a Python program to remove duplicates from a list.

Code:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
my_list = [1, 2, 2, 3, 4, 4, 5]
removed_list = list(dict.fromkeys(my_list))  # Or: list(set(my_list)) (unordered)
print("List without duplicates:", removed_list)
```

Output:

```
List without duplicates: [1, 2, 3, 4, 5]
```

d. Write a Python program to get the frequency of elements in a list.

Code:

```
my_list = ['a', 'b', 'a', 'c', 'b', 'a']
frequency = {}
for item in my_list:
    frequency[item] = frequency.get(item, 0) + 1
print("Frequency of elements:", frequency)
```

Output:

```
Frequency of elements: {'a': 3, 'b': 2, 'c': 1}
```

e. Find common items from two lists

Code:

```
list1 = [1, 2, 3, 4, 5]
list2 = [3, 4, 5, 6, 7]
common = list(set(list1) & set(list2))
print("Common items:", common)
```

Output:

```
Common items: [3, 4, 5]
```

f. Convert a list of multiple integers into a single integer

Code:

Marwadi University Marwadi Chandarana Group NAAC A+	**Marwadi University** **Faculty of Engineering & Technology** **Department of Information and Communication Technology**	
Subject: Programming With Python (01CT1309)	**Aim:** Write a python program to create, append and remove lists in python.	
Experiment No: 04	**Date:**	**Enrollment No: 92400133167**

```
int_list = [1, 2, 3, 4]
combined = int("".join(map(str, int_list)))
print("Combined integer:", combined)
```

Output:

```
Combined integer: 1234
```
